FULL PHYSICAL ERD | 18 ACTUAL EF CORE TABLES

Three SQL Server catalogs, one host. Solid relationship = enforced local SQL foreign key; unconnected means NO SQL FK in current EF Core model.

PK = primary key | FK = enforced SQL foreign key | UserId [logical only] = application ownership, NOT cross-database FK.

IdentityOutbox/Inbox, TrackingOutbox and WorkerOutbox/ProcessedEvents are event bookkeeping tables. Their relationships run through Redis, not SQL FKs.
