C2 | COMPONENTS + ALL 32 CONNECTED DATABASE TABLES

EXTENDED C2 / API components on left | actual SQL entities + Crow Foot/APP/EVENT relationships on right | source: current EF Core

REST API :8080 | gRPC :8081 (HTTP/2) | Redis :6379 (TCP) | SQL :1433 (TCP)

DATABASE KEY: I = LongevityDietDb (21) | T = LongevityTrackingDb (7) | W = LongevityWorkerDb (4)

C2 EXTENDED: 10 Controller → Service → Persistence paths connect to real tables. Table-to-table lines: SOLID CROW FOOT = 9 genuine SQL FKs; LONG DASH APP = 16 application associations; DOTTED EVENT = 6 event paths. Dashed links are NOT SQL FKs. TABLE REF names map to the real 32-table graph on the right. The Worker owns its own DB. gRPC is stateless and does not have a separate DB.

These are the 32 CURRENT EF Core mapped tables (I=21, T=7, W=4). Every table is connected to another table. Table cards show selected important columns; exact source definitions remain in EF Core. API/database access links are component usage, NOT extra SQL FKs.
